

Questions and Answers

1. Is there a drawing available for this unit?

Answer: A drawing is provided with the solicitation.

2. How is the unit being mounted? (There is no mention of a base or tank)

Answer: The unit is mounted in the utility body of a tactical truck outfitted for performing maintenance and repair on the battlefield. The base plate of the compressor mounts directly to the frame of the utility body, against a wall. This is an on-demand system; to conserve weight and space there is no reservoir tank.

3. Who was the previous supplier on this unit?

Answer: A suggested source of supply is provided in the solicitation.

4. How critical is the weight requirement?

Answer: The weight requirement is critical. The tactical truck has a strict weight budget to prevent overloading and maintain proper balance, and the full cargo capacity has already been allocated.

5. 3 Phase power normally requires a starter, check valve and pressure switch, is this required? (No mention of them in the request)

Answer: The starter and other items are not required.
